WHAT IS SOCIETAL DISTRESS?
Societal distress describes living conditions that do not satisfy basic human needs, such as food, shelter, health, income, and education. Visit www.humanneeds.vcu.edu for more details.

What is health?
Health is defined by the World Health Organization as “a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity.” Health distress is measured here in terms of shorter life expectancy, premature mortality (e.g., deaths before age 65), chronic illnesses, serious psychological distress, hospitalizations, and inadequate access to health care (being uninsured, lacking a usual source of care, or having to defer care due to costs).

How many Americans are affected?
- In 2006, 27.5% of all deaths in the United States occurred prematurely (before age 65).

As of 2007, the most current year for which statistics are available:
- 40.0% of adults age 18 or older suffered from at least one of the following six chronic diseases: diabetes, cardiovascular disease, chronic obstructive pulmonary disease, asthma, cancer, or arthritis.
- 8.3% of the population had been hospitalized in the preceding year.
- 2.7% of adults reported serious psychological distress.
- 14.7% of the population (43.2 million Americans) reported being uninsured and 16.2% of adults age 18 or older reported having no usual source of health care.

WHAT ABOUT THE RECESSION?
The data presented here predated the foreclosure and housing crisis and the current recession, during which precarious housing and homelessness are likely to have increased. For more details visit www.societaldistress.org.

In 2007, one out of 10 persons in the United States described their health as fair or poor.

THE PROJECT ON SOCIETAL DISTRESS is an initiative of the Virginia Commonwealth University Center on Human Needs, which examines the prevalence of societal distress in five domains—food security, housing, health, education, and income—and makes the information available to the public and policymakers. This research effort focuses on presenting accurate data on the number of Americans affected by these conditions and not examining the causes or proposing solutions. The Project on Societal Distress is funded by the W.K. Kellogg Foundation.
What are the trends?
Since the 1990s, the proportion of the population without health insurance has decreased among children and adolescents (under age 18) but has increased among adults, especially adults under age 45.

Who is affected?
Children: In 2007, 6.6 million children and adolescents, nearly one in every 10 (9.0%), were uninsured.

Seniors: In 2007, three out of four seniors (age 65 and older) suffered from at least one of six chronic diseases.

Minorities: In 2006, black infants were more than twice as likely as whites to die before their first birthday. Among adults age 18 and older, the prevalence of diabetes was 12.3% among blacks and 12.5% among Mexican Americans—nearly twice the diabetes prevalence in whites.

The Poor: In 2007, families living in poverty were over three times more likely to report fair or poor health status, and 5.3 times more likely to report serious adult psychological distress, than families with incomes at least twice the poverty threshold. Nearly one-third of the poor were uninsured.

Households with Less Education: In 2007, adults age 25 and older with less than a high school diploma were more than four times as likely to report fair or poor health as were those with a Bachelor’s degree or higher.

SOURCES AND METHODS
The statistics reported here were obtained from the U.S. Department of Health and Human Services report, Health, United States, 2008 and from the National Health Interview Survey (2007). The data underwent statistical analysis by the research staff of the Virginia Commonwealth University Center on Human Needs. Analytic methods are detailed at www.humanneeds.vcu.edu.

THE VIRGINIA COMMONWEALTH UNIVERSITY CENTER ON HUMAN NEEDS (www.humanneeds.vcu.edu) was chartered in 2007 to provide the public and policymakers with information about the prevalence of societal distress in the United States. Its mission is to document how many Americans confront food insecurity, precarious housing or homelessness, inadequate health and health care, inferior education, and inadequate income/poverty.
